

Asset Owner Action Plan

Task-oriented report for distributing remediation work to responsible teams.

Report Type	Remediation
Tool Source	Tenable.sc
Reporting Date	July 2026
Document Type	Remediation Guide

Contents

1. Owner Action Matrix
2. Team Instructions
3. Evidence Requirements

1. Owner Action Matrix

Owner Team	Finding	Asset	Required Action	Evidence Required
Application Team	Apache Tomcat AJP Request Injection and Potential RCE	10.20.1.234 / web-prod-01 / TCP 8009	Confirm whether the affected host is running a vulnerable Tomcat release and whether AJP is listening on TCP 8009.	Run a new authenticated vulnerability scan and confirm the CVE-2020-1938 finding is closed.
Network Team	SSL Certificate Cannot Be Trusted	10.20.1.235 / vpn-gw-02 / TCP 443	Identify the service, hostname, port, certificate subject, issuer, expiry, and chain presented by the affected asset.	Confirm OpenSSL chain verification returns OK using the approved CA bundle.
Database Team	Microsoft SQL Server Unsupported Version Detection	10.20.2.118 / sql-prod-03 / TCP 1433	Confirm the SQL Server version, edition, product level, and build number.	Confirm the version/build maps to a supported Microsoft lifecycle state.
Windows Platform Team	SMB Signing Not Required	10.40.8.21 / win-file-07 / TCP 445	Check whether SMB signing is required for both SMB client and SMB server configuration.	Confirm both RequireSecuritySignature values return True where policy requires signing.

2. Team Instructions

Application Team: Apache Tomcat AJP Request Injection and Potential RCE

- Confirm whether the affected host is running a vulnerable Tomcat release and whether AJP is listening on TCP 8009.
- If AJP is not required, disable the AJP connector in server.xml and restart Tomcat.
- If AJP is required, upgrade Tomcat to a fixed release and restrict AJP to a trusted interface or loopback address.

Identify Tomcat version and AJP listener

```
# Run on the Tomcat host
export CATALINA_BASE=${CATALINA_BASE:-/opt/tomcat}
export CATALINA_HOME=${CATALINA_HOME:-/opt/tomcat}
$CATALINA_HOME/bin/version.sh
sudo ss -lntp | grep ':8009' || true
sudo grep -R "protocol=\"AJP\" \"$CATALINA_BASE/conf\" \"$CATALINA_HOME/conf\" 2>/dev/null
```

Network Team: SSL Certificate Cannot Be Trusted

- Identify the service, hostname, port, certificate subject, issuer, expiry, and chain presented by the affected asset.
- If the certificate is self-signed or issued by an internal CA, either replace it with an approved publicly trusted certificate or add the internal CA to the scanner trust configuration where appropriate.
- If the certificate chain is incomplete, install the required intermediate certificates on the service.

Collect certificate and chain from the service

```
# Replace DNS and port with the affected service from the CSV
openssl s_client -connect vpn-gw-02:443 -servername vpn-gw-02 -showcerts </dev/null > vpn-gw-02_chain.txt
openssl x509 -in vpn-gw-02_chain.txt -noout -subject -issuer -dates -ext subjectAltName
```

Database Team: Microsoft SQL Server Unsupported Version Detection

- Confirm the SQL Server version, edition, product level, and build number.
- Compare the detected build with Microsoft lifecycle and latest-update guidance.
- Back up all affected databases and verify the backup before upgrade or migration.

Identify SQL Server version and edition

```
-- Run in SSMS or sqlcmd against the affected instance
SELECT @@VERSION;
SELECT
    SERVERPROPERTY('ProductVersion') AS ProductVersion,
    SERVERPROPERTY('ProductLevel') AS ProductLevel,
    SERVERPROPERTY('Edition') AS Edition;
```

Windows Platform Team: SMB Signing Not Required

- Check whether SMB signing is required for both SMB client and SMB server configuration.
- Enable SMB server signing for inbound connections on file servers.
- Enable SMB client signing for outbound connections on endpoints and servers that initiate SMB sessions.

Check current SMB signing status

```
Get-SmbClientConfiguration | Format-List RequireSecuritySignature
Get-SmbServerConfiguration | Format-List RequireSecuritySignature
```
