

MVA AI PDF Blueprint

This sample shows the structure MVA should send to the selected AI server so the generated PDF remains consistent, explainable, and customer-safe.

AI Server Instructions

Step	Instruction	Expected Behavior
1	Read only normalized MVA fields	Use IP, DNS, vulnerability name, CVE, severity, exploit availability, priority, exposure, finding evidence, remediation, KB links, platform, first and last observed dates.
2	Respect the selected summary date	Filter and describe findings according to the date/month selected by the analyst before the PDF is generated.
3	Use the priority matrix exactly	Exploit available plus Critical/High becomes P1; no exploit on Critical/High becomes P2; Medium maps to P2/P3; Low maps to P2/P4.
4	Write customer-safe language	Avoid unsupported claims. Separate confirmed evidence from recommendation. Do not expose raw secrets or unrelated CSV columns.
5	Use KB links as evidence	Summarize vendor/NVD/KB references and place links in a human-readable appendix.
6	Return structured sections	Executive summary, critical actions, technical queue, remediation plan, validation checklist, appendix.

Recommended AI Prompt Contract

You are the MVA remediation report writer. Produce concise, evidence-based vulnerability remediation language from normalized rows only. Use the selected summary date. Preserve severity, exploit availability, patch priority, KB links, first discovered, and last observed values. Never invent CVEs, asset names, exploit status, remediation completion, or business impact.

Data Package Sent to AI

IP Address	DNS Name	Vulnerability Name	CVE	Severity	Exploit	Priority	Exposure	Last Observed
10.20.1.234	web-prod-01	Apache Tomcat AJP Connector Request Injection	CVE-2020-1938	Critical	Yes	P1	920	2026-07-03
10.20.1.235	vpn-gw-02	SSL Certificate Cannot Be Trusted	N/A	High	No	P2	780	2026-07-03
10.20.2.118	sql-prod-03	Microsoft SQL Server Unsupported Version Detection	N/A	Critical	Yes	P1	860	2026-07-03

PDF Output Contract

Required Sections

- 1. Executive Summary
- 2. Immediate Patch Needed
- 3. Priority Matrix Explanation
- 4. Source Tool and Field Mapping
- 5. Remediation Queue
- 6. Finding Details with KB Links
- 7. Validation Checklist
- 8. Appendix

Finding	KB / Evidence Links	How MVA Uses It
Apache Tomcat AJP Connector Request Injection	https://nvd.nist.gov/vuln/detail/CVE-2020-1938 https://tomcat.apache.org/security-9.html	Referenced in remediation narrative, appendix, and analyst validation checklist.
SSL Certificate Cannot Be Trusted	https://docs.tenable.com/nessus/Content/SSLPlugins.htm	Referenced in remediation narrative, appendix, and analyst validation checklist.
Microsoft SQL Server Unsupported Version Detection	https://learn.microsoft.com/lifecycle/products/	Referenced in remediation narrative, appendix, and analyst validation checklist.
Remote Code Execution in Web Application Component	https://nvd.nist.gov/ https://www.cisa.gov/known-exploited-vulnerabilities-catalog	Referenced in remediation narrative, appendix, and analyst validation checklist.
